# Documentation

Create a website

To create a website in wordpress we need to know how to add blogs, web pages, pictures, forms and more. I will explain how I did to achieve this.
But before we start to creating the website we need of course to have our server up and running and log in to our wordpress account

Blogs
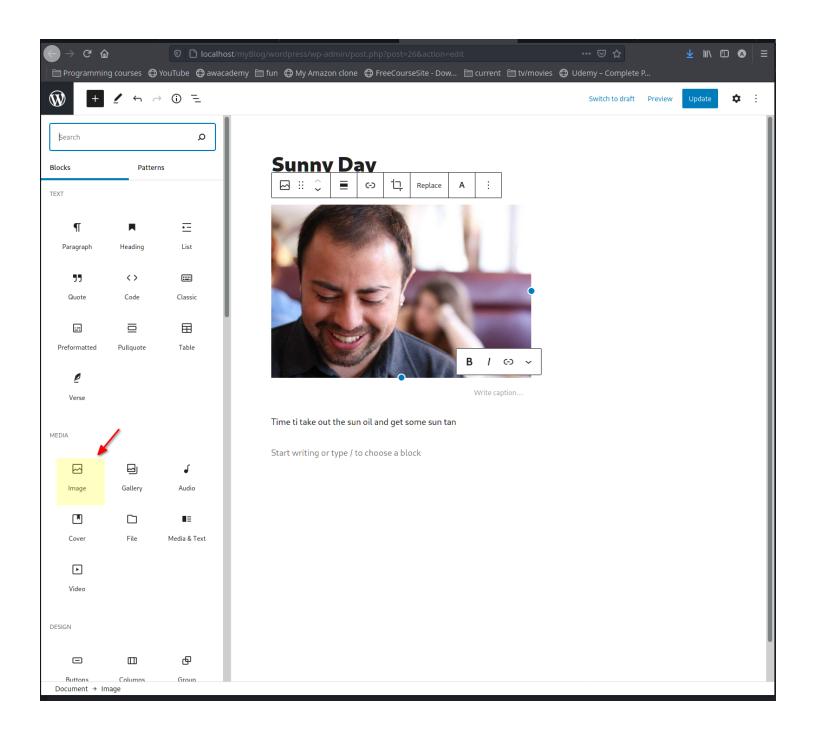

To add blog in wordpress we need to find the icon that look like a pin on the left side panel. Please choose add post. On the right side you will see that you can write title, content and even add pictures and then just hit publish on he top right side button.
Then if you go to the main page you will see the new post appear because we already wrote the necessary php code in previews assignments.
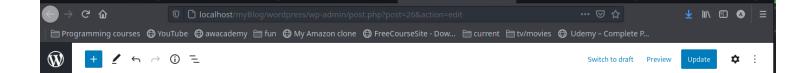

Images

To add images to the blogs just click the plus sign at the top left corner to add a new block and choose image as show in the screenshot below. Here you have the choice to upload a picture och choose one from the library, after that you can publish as show above.

Programming courses   YouTube   awacademy   fun   My Amazon clone   FreeCourseSite - Dow...   current   tv/movies   Udemy – Complete P...

Web Pages

To add a page i s similar to the blogs, but this time you choose in the left side panel, add new page. Screenshot below, then write the content of your page, and click publish.

If you want to do more in this page, you can choose to view as html and write the necessary html code and style for make it more beautiful. then just publish and you will see a link to the new page appears on the nav bar. Because we have already wrote the php code to generate a new link from pages.

Title of the page

Text block

Image block
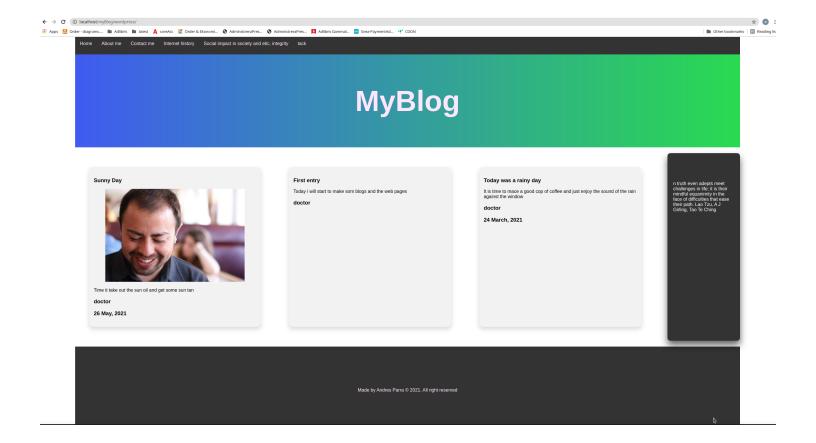

Index

I tried to make an start pages that follow my accessibility thinking. Not bloated, clear text. The nav bar will follow in every page for easy navigation, no unnecessary text och pictures that will make the user disoriented and hard to find the necessary links.

The footer will also be constant. when you hover the nav bar link they will change color so the user can easy know what he is doing.

n truth even adepts meet challenges in life; it is their mindful equanimity in the face of difficulties that ease their path. Lao Tzu, A J Girling, Tao Te Ching

Additional pages

here are screenshot of my different pages

page about history and integrity

  in this page i choose to use div with class name card. this will wrap around the content of the page and add a little shadow for a nice effect. then sidebar will contain words of wisdom. in this page and the follow i use the elements, divs, h,p.

late 1960 ARPA (Advanced Research Projects Agency)

started its first test with computer in UCLA and another in Stanford, Sudents from UCLA could access the database from Stanford. After successfull testing they expanded the amount of computers connected and 1974 there was 5o connected computers ARPANET was online. But it was a close network.

1973 started the development of internetworking or connecting multiple networks. and with that ame the tcp/ip protocoll .

Then cams USENET AND Telnet, and here things tarted to get faster and interesting, even email.

1994 there was around 3000 webpages, and two year later there was around 2.5 million websites, and from there it grow to the amazon internet that there is today.

Now everything is connected, smart tvs , mobile phones, cars, buses, i would say almost everything in our lives are in one way or another connected to the internet.

like lights in the home yo can turn of with the phone or coffemachine, and even toothbrush, send data over the internet so you can see that data in a nice graph how you bursh our teeths.

In the futue it is estimate that the amount of internet connected devices will reach 75 billion. And a new technoogi called Li-Fi will eventually replace wifi. it can transfer 225 gigabytes per second

MyBlog

Well, what can i say here, internet is a part of almost everything. And it has a big impact in society.

he answer this questions. I will talk about an own example from my own experience.

I have made my whole home like a smart home. for example when I am five minutes from getting home, google will know this by getting my GPS location and start the coffee machine. So when I arrive home I am welcome with a pleasant coffee smell.

When I go to sleep I say goodnight and the tv in the living room, speakers and everything will turn off. Then ask me for what time to set the alarm for the next day.

When I run I also use run keeper app for track my speed, calories etc.

And the apps want me to stay on track if I miss running some days, or that now that I have run so many km then I should buy Asics tuning shoes…etc

But in this case I am aware of how the people that program the sites try to to make me buy this brand shoes or guilt-trip me if I dint run enough this week or not burn enough calories and I can see how they want some some kind of control of my life. And because this awareness I dont live and breathe about what my running app tells me to do, or what netflix suggest me to watch or what product I is the perfect for me, or what news to see. Of course I dont say I dont follow any suggestions or so in the apps, or browser or computer. But I am aware of what company want with this website, if the product of this free site/app is ME (because nothing is really free, and a lot of information about me my integrity get passed around) and then I try to make an informed decisions. Do I still fall into traps that the internet companies want me to? sure, I am only human.

It is very important to have awareness about internet and that you how they program devices, apps and websites and what they really want us to do and be critic. Also is important to know that we can change the thing in internet , they are not almighty and that WE can change what information we want or not by taking action and have a voice out there.

The examples above are just few things.. there are devices connectet to the internet everywhere around us. from smart watches, toothbrushes with a.i that suggest you how to brush your teeth, smart lights, of course computers and phones, smart tv:s that always can show you what you should see. weight scales, that can tell you body fat(not accurate) weight, pulse etc, send this to your phone and then show you your progress or opposite. The list are endless.

David Lazer, professor of political science and computer and information science at Northeastern University explain very well in this video about how is the democracy today with fake news, social networks and algorithms.

https://www.cornell.edu/video/democracy-today-fake-news-social-networks-algorithms

just one example of many in this video is the rise of synergistic (parasitic) system: the meta mediators. Like how we find out about the world via mediators, google, facebook or twitter to name a few because we are not really experiencing it our self's for example what happens in Iran, syria etc. And in this way they can have power of how and what we get for info… Because for example google controls whats going to show in the first few pages in a search, people almost never go to the search result page 30 to look for info. Because we think that the most relevant info is maybe the first or second page. And let me tell you it is absolutely not true. I have a friend that works in this area in google to make algorithms about what should be shown or not show in the search result.

Another example is facebook. It have a system to choose to show a post from this friend or this friend but now from this other friend.

Forms

for this site i added the code for a form, and played with frame-rates and animation using only css and not javascript. I like specially the submit button that will have a blue line moving around so the users

eyes get drawn to it. also when you write the user name and the email, the words: 'username' and 'email, will move back and change color.
Then when you fill the necessary info and hover oer the submit button it will glow in a pleasant blue color, so then you will know you are going to click and send the form.

Accessibility

I followed the previous statements:

- Have the same style throughout the whole website

- Good contrast.

- Make the navigation bar easy to find in every page

- Make the links of the nav bar change color wen hovering

- Use html elements for list

- Make the form easy and clear to he user.
- Make the website print friendly
